Supreme Cli-entele II

- The Heroku “CLI” (Command Line Interface) allows us to:
  - Log in to Heroku
  - Check the status of our apps
  - Look at logs in real-time
  - ...many more “back-end” specific thing
- Having installed it, we need to log in:

```
heroku login
```

remote work

We need to add the Heroku server as a “remote” – a place where we can put things.

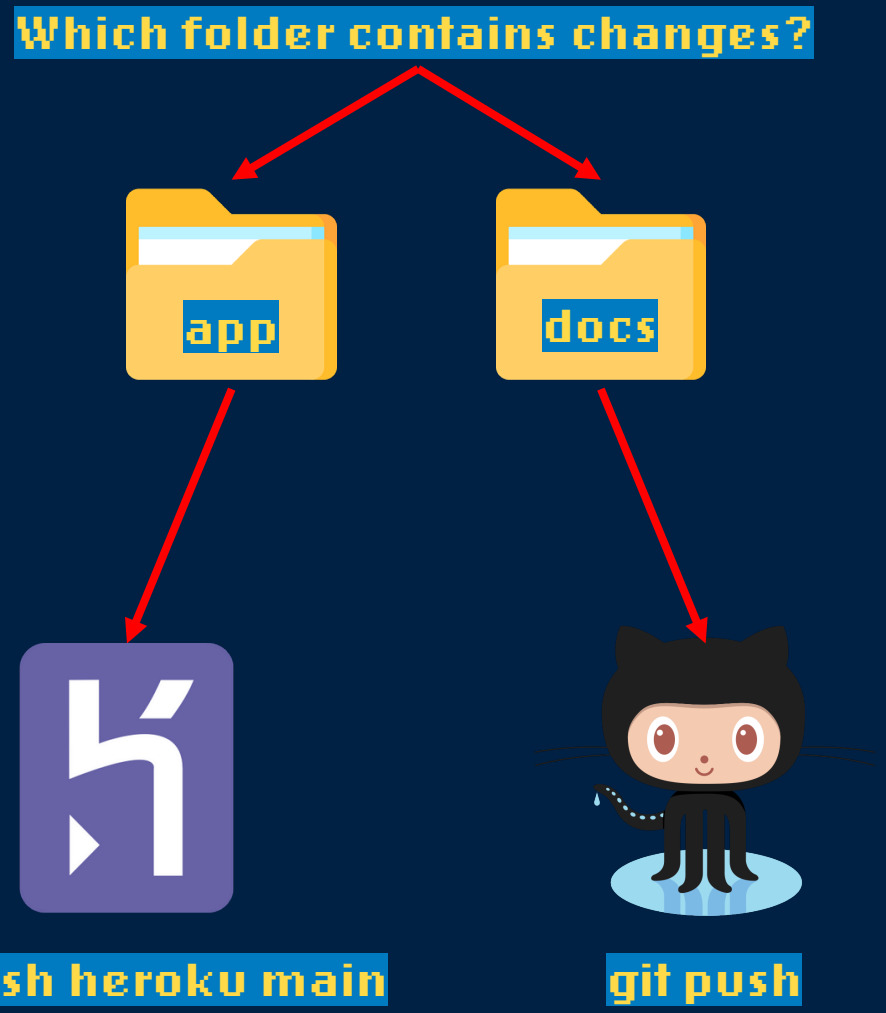
heroku git:remote

remote work

git push heroku main

git push

push-ing back



feature creatures

Some ideas for “features” for folks who’d like some suggestions:

- Make all links that appear in chat click-able
  - This will involve additional Javascript and the “target” HTML attribute
- The ability to change your message color using a “slash” command (rly any /slash command):

  i.e. /red My message should be RED! » My message should be RED!
- The ability to use :emoji: syntax to add emojis to messages
  - You get to choose which/how many
  - Example: :boss: »

feature creatures FAQ

- Is this a back- or front-end feature?
  - i.e. does it belong in app/server.js or script/client.js?
  - How do we make that choice?
- What skills/knowledge does implementing this feature involve that I don't know yet?
  - Hmm...how can we learn these?
    - StackOverflow
    - W3C
    - MDN
    - But, probably StackOverflow
